

ABSTRACT

If you run a business, you have a choice when it comes to handling sales. You can choose a traditional cash register, which keeps track of the money your business has taken in each day, or a point-of-sale system that provides a number of additional features as well.

In the existing System it is difficult to maintain the car information individually and to supply for the customers who are eager to buy them. Customer has to face difficulty in order to know the information of car like manufacturing year, car model and other valuable information in a single domain. Our main idea is to develop a system where we can have all the required information for the user in order to effectively interest him in the process of buying a car. In the Proposed System, application can maintain car details like manufacturer, year of manufacturing, price and model etc. We can also view all the car details which are kept for sale effectively and we can search for our desired car. With this Customer can get the information quickly like car details which have been entered clearly. This application mainly consists of 5 modules: user module, admin module, dealer module, viewing all cars module, adding cars module.
